

Toronto-St. Paul's 2024 Federal By-Election Questionnaire

Introduction

During the 2021 federal election, Prime Minister Trudeau promised to establish Clean Electricity Regulations that would lead to a net zero-carbon Canadian electricity grid by 2035.

Unfortunately, the Government of Canada's draft Clean Electricity Regulations would permit the carbon emissions of Ontario's gas-fired power plants to be at least three times greater than their 2017 level in 2035. We are going in the wrong direction.

In December 2023 at the Climate Summit in Dubai, 198 governments (including Canada's) pledged to triple the world's renewable electricity by 2030 and double its energy efficiency.

Ontario can phase-out gas power by 2035 and lower electricity bills by investing in energy efficiency and tripling wind and solar energy in the province.

Question

Should the Government of Canada establish Clean Electricity Regulations that will require Ontario's electricity grid to be net zero-carbon by 2035?

Answer

Yes No Undecided

Additional Comments

Ambitious, binding clean electricity regulations are absolutely necessary in order to avert climate catastrophe. Implementing a national, 100 per cent renewable electricity grid by 2030 has consistently been a part of the Green Party of Canada's platform. As your next MP, I am

committed to exposing government green-washing and ensuring a sustainable future for generations to come.
